# Bi- or Multi-plane Imaging is a 3D Mode

## 1. Image Optimization

## 2. Acquisition Modes

Spatial vs temporal resolution  
Gating artifacts

- Zoom
- Narrow volume
- Wide volume
- Single beat
- Multi-beat
- Color Doppler

## 3. Rendering

- Cropping
- Thresholds

## 4. Final Image Display + Analysis

# Acquisition: 2D Image Quality

- Before 3DE acquisition, the 2D image should be optimized
  - Poor 2D images, poor 3D images

# Acquisition: Image Optimization Multiplane Viewing

# Image Resolution

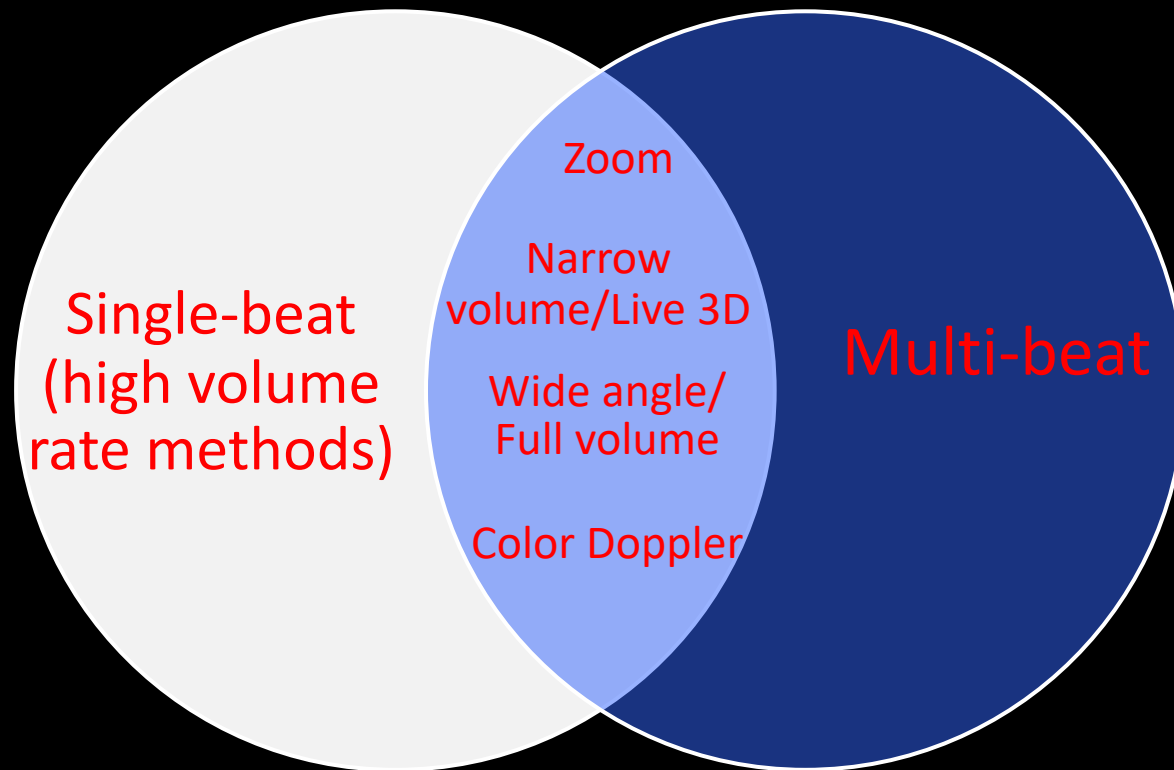

Image perpendicular to the beam for the best image

# Image Quality

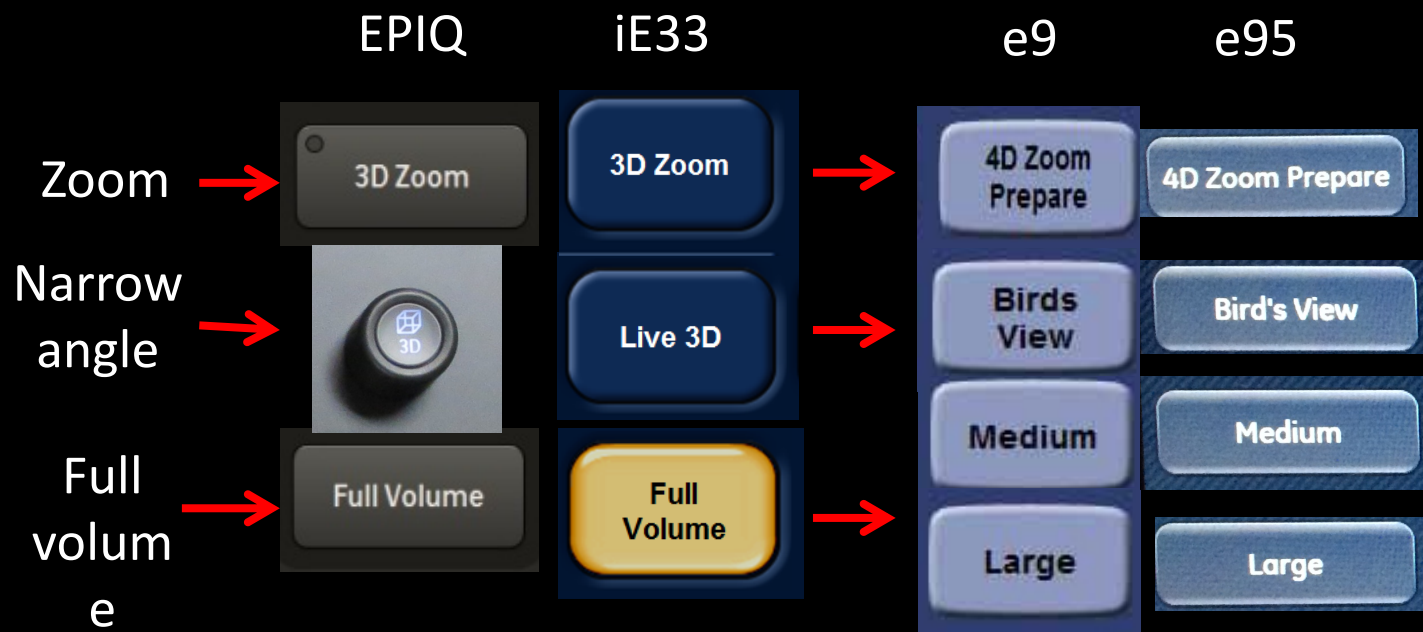

# Modes of Acquisition

# Select Acquisition Mode

Zoom ↔ Narrow Sector (Live) ↔ Wide Sector (Full Volume)

# Zoom Mode

# Zoom Mode

- Indications:
  - Valves
  - ASD
  - VSD
  - small, fast moving structures
- Beware of losing spatial orientation

# Narrow Volume

- Useful for procedures

# Wide Angle

# Pyramidal size

4- Beat, 30 Hz

4- Beat, 20 Hz

# What size to choose?

## **Narrow angle/Zoomed**

- Valves
- Inter-atrial septum
- Inter-ventricular septum

## **Wide angle**

- LV
- RV
- Whole heart

# Trade Offs

**Volume  
Rate**

**Resolution**

**Volume  
Rate**

**Resolution**

**Volume  
Rate**

**Resolution**

# Single or Multi-beat

## Single-beat acquisition

- acquisition of multiple pyramidal data sets per second in a single heartbeat

# Single or Multi-beat ECG-triggered multiple-beat acquisition

# Methods to Increase Volumes Rates

- Built in
  - Parallel beamforming
  - Frame reordering
  - Multiline transmission
  - High pulse repetition
- Controllable
  - Interpolation
  - Virtual array

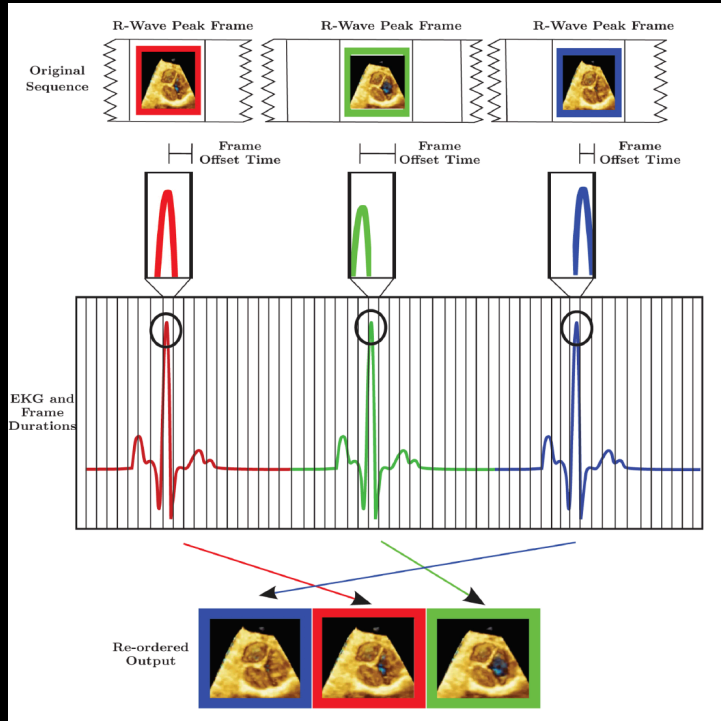

# PARALLEL BEAMFORMING

One transmit beam  
Multiple receiving beams  
Increases volume rate by number of  
receiving beams.

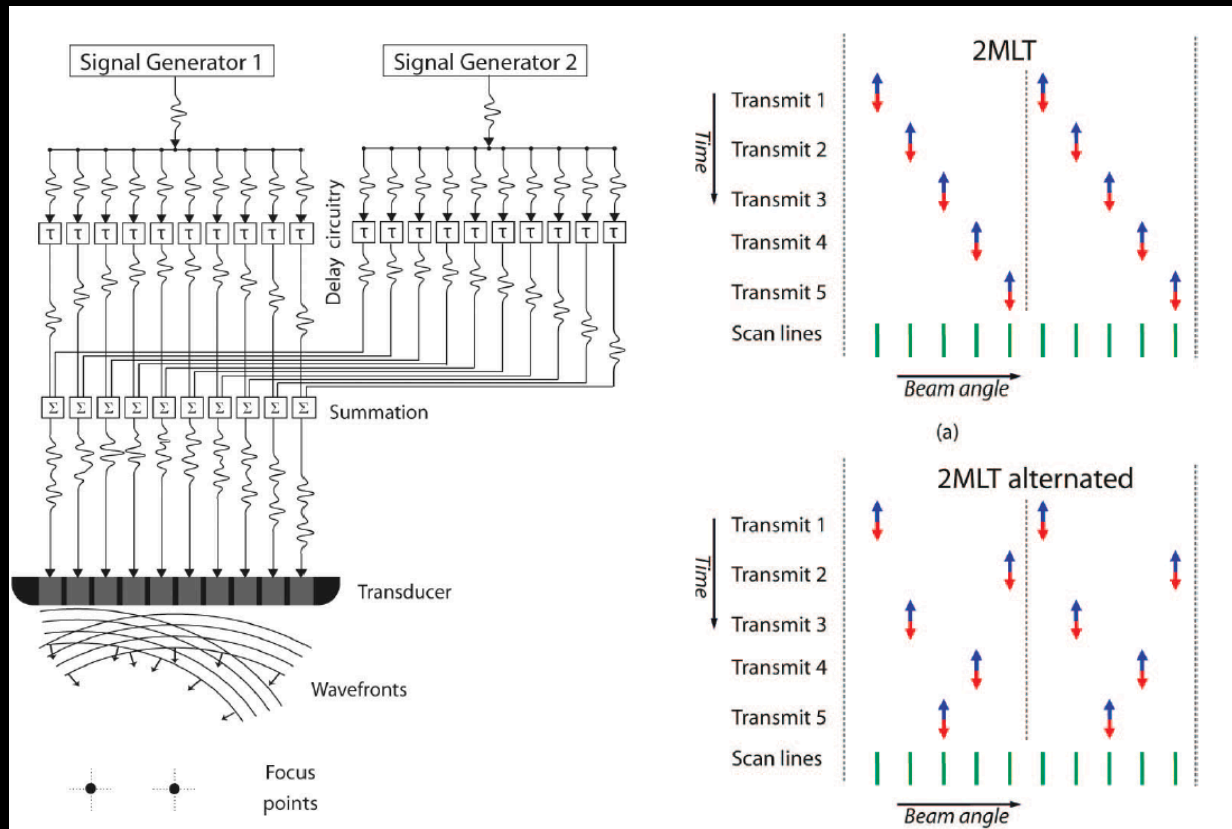

# FRAME REORDERING

- high frame (volume) rate algorithm is used that reorders 3DE volumes of a periodically moving cardiac structure taken at a number of instances over several cardiac cycles.

# MULTILINE TRANSMISSION

- multiple ultrasound pulses focused along different steering directions are transmitted simultaneously

# HIGH PULSE REPETITION FREQUENCY

- Pulses are transmitted with three times the frequency that is needed to allow the echo from the farthest depth to return
  - I.E. IF two pulses are emitted, the echo from the first pulse will return from the farthest depth at the same time the echo from the second pulse returns from an intermediate depth. When this occurs, there is no way to determine whether the signal originates from the deepest or the intermediate level. The high-pulse repetition frequency increases the Nyquist limit, thereby shortening the acquisition time.

# Interpolation

## 1<sup>st</sup> Cardiac Cycle

- **BLUE** squares are scanned
- Missing **RED** squares are estimated using the surrounding **BLUE** squares

- Estimated squares are shown as the **PINK** squares

# Interpolation

## 1<sup>st</sup> Cardiac Cycle

- **BLUE** squares are scanned
- Missing **RED** squares are estimated using the surrounding **BLUE** squares

- Estimated squares are shown as the **PINK** squares

## 2<sup>nd</sup> Cardiac Cycle

- **RED** squares are scanned
- Each **PINK** square is 'contrasted and compared' to the matching **RED** square in the previous cardiac cycle

- If the **RED** square is similar to the **PINK** square value, then the **PINK** square is replaced by the **RED** square

# Virtual array

Piezoelectric  
array

Wider base, pointed apex

VR 17 Hz

Narrow base, flat apex

VR 31 Hz

# Increasing Volume Rate – Virtual Apex

Philips iE33  
‘Res-Spd’

Default  
setting

Optimized – at 12  
o'clock position
